

CONDOR/-XL

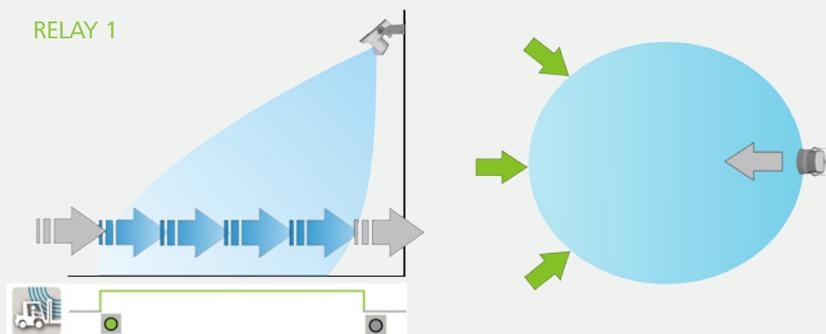

What possibilities offers the output redirection setting?

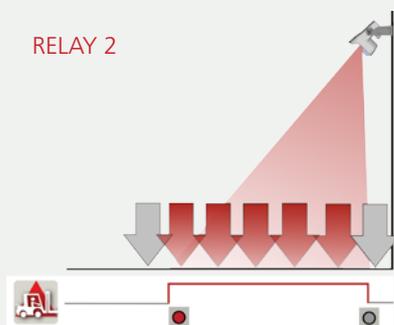

F1 0

FACTORY VALUE

RELAY 1 is - activated (door opens) in case of motion detection in the radar field.
 - deactivated when there is no more motion detection in the radar field.

RELAY 2 is - activated (door is kept open) in case of presence detection in the infrared field.
 - deactivated when there is no more presence detection in the infrared field.

The behaviour of RELAY 2 is the same for each output redirection value.

CAUTION! The settings of the radar detection field influence the output redirection. In all images the radar field is considered unidirectional.

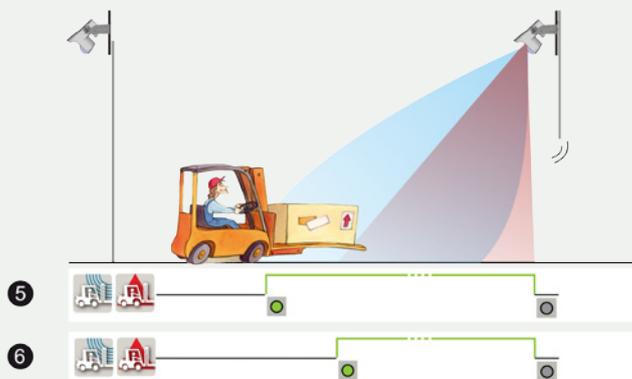

F1 5

RELAY 1 is - activated (door opens) in case of motion detection in the radar field.
- active as long as there is a presence in the infrared field.
- deactivated when there is no more presence detection in the infrared field.

F1 6

RELAY 1 is - activated (door opens) in case of motion detection in the radar field and presence detection in the infrared field.
- active as long as there is a presence in the infrared field.
- deactivated when there is no more presence detection in the infrared field.

AIRLOCK APPLICATIONS

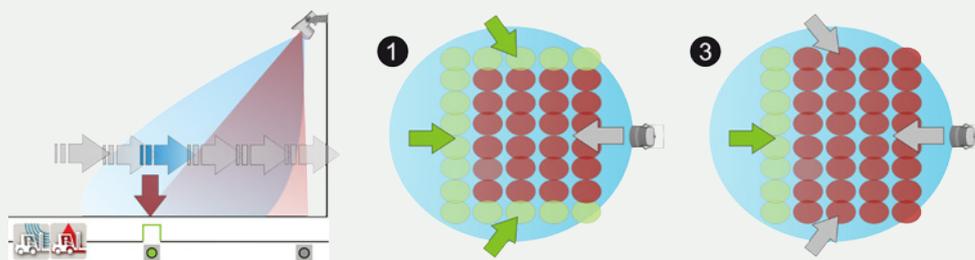

F1 1

RELAY 1 is - shortly activated (pulse - door opens) in case of motion detection in the radar field & presence detection when **entering** the infrared field.
- deactivated after the pulse duration (~= 500 ms)

F1 3

RELAY 1 is - shortly activated (pulse - door opens) in case of motion detection in the radar field & presence detection when **entering** the infrared field **frontally** (first IR line).
- deactivated after the pulse duration (~= 500 ms)

F1 2

RELAY 1 is - shortly activated (pulse - door opens) in case of motion detection in the radar field & presence detection when **exiting** the infrared field.
- deactivated after the pulse duration (~= 500 ms)

F1 4

RELAY 1 is - shortly activated (pulse - door opens) in case of motion detection in the radar field & presence detection when **exiting** the infrared field **frontally** (last IR line).
- deactivated after the pulse duration (~= 500 ms)
